

Audiomods tonearm kit II

A high-end tonearm in a DIY package

Not a conversion but a built-from-scratch new arm.

The arm kit has the design features and components of our finished arms, including the ceramic bearings and contrained-layer counterweight in a DIY package.

Kit II builds an arm identical to the latest Classic II arm and features a new Rega 303 arm tube casting and arm lift, Audiomods alloy arm rest, stainless steel vta lock and variable mass counterweight.

Included in the kit are all the parts needed to complete the arm and all that is needed is to add wiring. There is a wide choice of wiring options, from the kits sold for RB series arms or your own solution from any quality tonearm wire. You can choose to add our Cardas wiring loom which comes ready-installed into the base when ordered as part of the kit and is supplied with a set of silver-plated Michell cartridge tags.

To build the kit you will need access to some basic power tools for finishing and drilling the bare arm tube, simple hand tools for assembly and some practice with soldering the fine signal wires.

The kit comes with complete build and setup instructions and a drilling template. Each kit is built to order with a delivery time of 3-4 weeks.

See page 2 for details and options

New features

Kit II complete

Standard version £295

Micrometer version £385

Options

Stainless steel counterweight £20
